## - jQuery Selectors and DOM Manipulation

### Question 1:

What does the following jQuery selector do?

```
```js
$('div.myClass')
```
```

- A) Selects all ` ` elements with class `myClass`
- B) Selects all elements with class `myClass` inside ` ` elements
- C) Selects all ` ` elements with id `myClass`
- D) Selects all elements with class `div.myClass`

Correct Answer: A

Explanation:

The `\$( )` function is used to select elements in jQuery. The selector `div.myClass` targets all ` ` elements that have the class `myClass`. The syntax combines the element selector `div` with a class selector `.myClass`.

Key Point:

- `div.myClass` matches ` ` elements.

### Question 2:

How can you change the text of a paragraph with id `para1` to "Hello World"?

- A) `\$('para1').text('Hello World');`
- B) `\$('para1').html('Hello World');`
- C) `\$('para1').val('Hello World');`

D) Both A and B

Correct Answer: D

Explanation:

- `.text()` sets or gets the text content of selected elements.
- `.html()` sets or gets the HTML content inside the element.
- For plain text, both methods work, but `.text()` is preferred for plain text as it escapes HTML.
- `.val()` is used mainly for form elements like input fields.

- jQuery Event Handling

Question 3:

Which jQuery method is used to assign a click event to a button?

A) `.on('click', function({}))`

B) `.click(function({}))`

C) Both A and B

D) None of the above

Correct Answer: C

Explanation:

- `.on('click', function({}))` is the preferred, flexible way to attach event handlers.
- `.click(function({}))` is a shorthand for the same.
- Both methods are valid for binding click events.

Question 4:

What is the purpose of `event.preventDefault()` in jQuery?

A) Stops the default action of an event, like form submission or link navigation

B) Stops the event from propagating to parent elements

C) Both A and B

D) Resets the event object

Correct Answer: A

Explanation:

- ``preventDefault()`` prevents the default browser behavior associated with an event, such as following a link or submitting a form.

- To stop event propagation, ``event.stopPropagation()`` is used.

- jQuery Effects and Animations

Question 5:

Which method is used to hide an element with a fade effect?

A) ``hide()``

B) ``fadeOut()``

C) ``slideUp()``

D) ``effect('fade')``

Correct Answer: B

Explanation:

- ``fadeOut()`` gradually decreases the opacity of the element to hide it.

- ``hide()`` instantly hides the element without animation.

- ``slideUp()`` collapses the element vertically.

- ``effect()`` is not a standard jQuery method.

Question 6:

How do you animate the width of a ` to 300px over 1 second?

- A) ``$('div').animate({width: '300px'}, 1000);``
- B) ``$('div').slideDown(1000);``
- C) ``$('div').resize({width: '300px'}, 1000);``
- D) ``$('div').effect('width', 300, 1000);``

Correct Answer: A

Explanation:

- The ``animate()`` method allows for custom animations of CSS properties over a specified duration in milliseconds.

- jQuery AJAX and Data Handling

Question 7:

Which method is used in jQuery to load data from the server without refreshing the page?

- A) ``ajax()``
- B) ``load()``
- C) ``get()``
- D) All of the above

Correct Answer: D

Explanation:

- ``ajax()`` is a powerful method for making asynchronous requests.
- ``load()`` loads HTML content into an element from the server.
- ``get()`` is a shorthand for GET requests. All can be used for data retrieval.

## Question 8:

What does the following code do?

```
```js
$.ajax({
  url: 'data.json',
  method: 'GET',
  success: function(data) {
    console.log(data);
  }
});
```
```

- A) Sends an AJAX GET request to `data.json` and logs the response
- B) Loads the JSON data into the page
- C) Sends a POST request to `data.json`
- D) None of the above

Correct Answer: A

Explanation:

This code performs an asynchronous GET request to fetch `data.json` and logs the data upon success.

- jQuery Plugins and Extensibility

## Question 9:

How can you initialize a jQuery plugin on an element?

- A) ``$(selector).pluginName();``
- B) ``$(selector).pluginName({options});``
- C) Both A and B depending on plugin requirements
- D) ``$.pluginName(selector);``

Correct Answer: C

Explanation:

- Many plugins are initialized with method calls like ``$(selector).pluginName();``
- Some accept options as an object, e.g., ``$(selector).pluginName({option1: value});``
- The exact method depends on the plugin's design.

- Miscellaneous jQuery Features

Question 10:

What is the purpose of the ``$(document).ready()`` function?

- A) Executes code after the DOM is fully loaded
- B) Executes code after all images are loaded
- C) Executes code after the entire page, including images, is loaded
- D) Executes code immediately

Correct Answer: A

Explanation:

- ``$(document).ready()`` ensures the code runs after the DOM tree is ready but before images and other resources are fully loaded.

- For waiting until all resources load, use ``window.onload``.

## Best Practices When Approaching jQuery MCQs

**QuestionAnswer** What is the primary purpose of jQuery in web development? jQuery is a fast, small, and feature-rich JavaScript library that simplifies HTML document traversal, event handling, animation, and Ajax interactions, making it easier to develop cross-browser compatible web applications. How can you select multiple elements using jQuery? You can select multiple elements by separating their selectors with commas inside the jQuery selector, e.g., `$(div, p, span)`, which targets all div, p, and span elements simultaneously. What is the difference between `.each()` and `.map()` methods in jQuery? The `.each()` method iterates over a set of elements, executing a function for each element, typically used for side effects. The `.map()` method also iterates but transforms each element into a new value, returning a new jQuery object containing these transformed elements. How do you handle multiple checkbox selections using jQuery? You can select all checked checkboxes with a common class or attribute, e.g., `$(input[type=checkbox]:checked)`, and then iterate over them or retrieve their values as needed. What is the use of the jQuery `.multiple()` method? Actually, jQuery does not have a built-in method called `.multiple()`. However, handling multiple selections or operations on multiple elements is achieved through selectors combined with methods like `.each()`, `.map()`, or event delegation, depending on the requirement.
