Sample DU A Unit Chemistry Question and Its Step-by-Step Solution

Question:

Calculate the number of moles in 22.4 liters of a gas at standard temperature and pressure (STP).

Step 1: Understand the problem

The question asks for the number of moles, given a volume at STP. This is a classic molar volume problem.

Step 2: Recall relevant concept

At STP (Standard Temperature: 0°C or 273.15 K, and Pressure: 1 atm), one mole of any ideal gas occupies 22.4 liters.

Step 3: Apply the molar volume fact

Using the molar volume:

- 1 mole of gas = 22.4 liters at STP

Step 4: Set up the proportion

Number of moles = Volume of gas / Molar volume

Number of moles = 22.4 liters / 22.4 liters = 1 mole

Answer:

There is 1 mole of gas in 22.4 liters at STP.

Common Challenges and How to Overcome Them

Misinterpretation of Questions

Always read questions multiple times. Highlight key data points and what the question specifically asks.

Incorrect Application of Formulas

Ensure you understand the derivation and conditions under which formulas are valid. For example, ideal gas law assumptions may not hold for real gases at high pressure.

This guide aims to enhance your problem-solving skills, deepen your conceptual understanding, and prepare you for similar questions in your exams.

Introduction to DU Chemistry Unit Questions

DU's chemistry syllabus is designed to test both theoretical knowledge and practical application skills. The questions often combine multiple concepts such as atomic structure, chemical bonding, thermodynamics, equilibrium, kinetics, and periodic properties.

Key features of DU unit questions include:

- Multiple-step problems requiring logical reasoning.
- Application of mathematical formulas with precise calculations.
- Emphasis on conceptual clarity rather than rote memorization.
- Integration of various topics into a single problem.

Example Question Overview

Let's consider a representative DU unit chemistry question that involves concepts of chemical equilibrium, thermodynamics, and molar calculations:

A 0.5 mol sample of a gas is contained in a 10 L vessel at an initial temperature of 300 K. The gas undergoes a reaction:

with an equilibrium constant ($K_c = 2.0$) at this temperature. Calculate:

- The equilibrium concentrations of A and B.
- The change in Gibbs free energy (ΔG°) for the reaction at 300 K.
- The amount of B formed at equilibrium.

Step-by-Step Breakdown of the Solution

Understanding the Question and Gathering Data

Given Data:

- Initial moles of A, $n_{\text{A}_{\text{initial}}} = 0.5 \text{ mol}$
- Volume of the container, $V = 10 \text{ L}$
- Temperature, $T = 300 \text{ K}$
- Equilibrium constant, $K_c = 2.0$

Goals:

- Find equilibrium concentrations of A and B.
- Calculate ΔG° .
- Determine the moles of B formed at equilibrium.

Fundamental Concepts and Formulas Involved

- Concentrations from Moles and Volume:

$$[\text{A}] = \frac{n_A}{V}$$

]

[

$$[\text{B}] = \frac{n_B}{V}$$

]

- Equilibrium Constant Expression:

For the reaction:

[

]

[

$$K_c = \frac{[\text{B}]_{\text{eq}}}{[\text{A}]_{\text{eq}}}$$

]

- ICE Table (Initial, Change, Equilibrium):

Set up for the reaction:

[

]

	Initial (mol)	Change (mol)	Equilibrium (mol)

--	--	--	--

$$| A | 0.5 | \backslash(-x) | \backslash(0.5 - x) |$$

$$| B | 0 | \backslash(+x) | \backslash(x) |$$

Note: Since initial B is zero, and x is the moles of B formed at equilibrium.

Calculating Equilibrium Concentrations

Step 1: Convert initial moles to molar concentrations

$$\backslash[\text{[text{A}]}_{\text{initial}} = \frac{0.5 \backslash, \text{mol}}{10 \backslash, \text{L}} = 0.05 \backslash, \text{M} \backslash]$$

Since initially, $\backslash(\text{[text{B}]} = 0 \backslash)$.

Step 2: Write equilibrium concentrations

$$\backslash[\text{[text{A}]}_{\text{eq}} = 0.05 - \frac{x}{10} = 0.05 - 0.1x \backslash]$$

$$\backslash[\text{[text{B}]}_{\text{eq}} = \frac{x}{10} = 0.1x \backslash]$$

Step 3: Use $\backslash(K_c)$ to find $\backslash(x)$

$$\backslash[K_c = 2.0 = \frac{\text{[text{B}]}_{\text{eq}}}{\text{[text{A}]}_{\text{eq}}} = \frac{0.1x}{0.05 - 0.1x} \backslash]$$

Step 4: Solve for $\backslash(x)$

$$\backslash$$

$$2.0 (0.05 - 0.1x) = 0.1x$$

$$\backslash$$
$$\backslash$$

$$0.1 - 0.2x = 0.1x$$

$$\backslash$$
$$\backslash$$

$$0.1 = 0.3x$$

$$\backslash$$
$$\backslash$$

$$x = \frac{0.1}{0.3} = \frac{1}{3} \approx 0.333, \text{ mol}$$

$$\backslash$$

Step 5: Find equilibrium concentrations

$$\backslash$$

$$[\text{A}]_{\text{eq}} = 0.05 - 0.1 \times 0.333 \approx 0.05 - 0.0333 = 0.0167, \text{ M}$$

$$\backslash$$
$$\backslash$$

$$[\text{B}]_{\text{eq}} = 0.1 \times 0.333 \approx 0.0333, \text{ M}$$

$$\backslash$$

Calculating the Change in Gibbs Free Energy (ΔG°)

Formula:

$\backslash[$

$$\Delta G^\circ = -RT \ln K_c$$

 $\backslash]$

where:

$$- \text{ } (R = 8.314 \text{ J mol}^{-1} \text{ K}^{-1})$$

$$- \text{ } (T = 300 \text{ K})$$

$$- \text{ } (K_c = 2.0)$$

Calculation:

 $\backslash[$

$$\Delta G^\circ = - (8.314)(300) \ln 2.0$$

 $\backslash]$ $\backslash[$

$$\ln 2.0 \approx 0.693$$

 $\backslash]$ $\backslash[$

$$\Delta G^\circ \approx - (8.314)(300)(0.693) \approx - (8.314 \times 300 \times 0.693)$$

 $\backslash]$

Compute step-by-step:

 $\backslash[$

$$8.314 \times 300 = 2494.2$$

 $\backslash]$

$$\backslash$$

$$2494.2 \times 0.693 \approx 1727.3, \text{J/mol}$$

$$\backslash$$

Result:

$$\backslash$$

$$\boxed{\Delta G^\circ \approx -1727, \text{J/mol}}$$

$$\backslash$$

The negative sign indicates the reaction is spontaneous under standard conditions.

Determining the Moles of B at Equilibrium

From earlier calculations:

$$\backslash$$

$$n_{\text{B, eq}} = [\text{B}]_{\text{eq}} \times V = 0.0333, \text{M} \times 10, \text{L} = 0.333, \text{mol}$$

$$\backslash$$

Summary:

- Equilibrium concentration of A: approximately 0.0167 M
- Equilibrium concentration of B: approximately 0.0333 M
- Moles of B formed at equilibrium: approximately 0.333 mol
- ΔG° : approximately -1727 J/mol

Conceptual Deep Dive

- The Significance of Concentrations and Moles:
- Converting between moles and molarity is crucial for applying equilibrium expressions.
 - The initial amount of reactant determines the maximum possible amount of product formed.
- The ICE Table Approach:
- A systematic method to handle initial data, changes, and equilibrium states.
 - Helps visualize the problem and reduces errors.
- Thermodynamic Calculations:
- The formula $(\Delta G^\circ = -RT \ln K_c)$ links equilibrium to thermodynamics.
 - Understanding the sign and magnitude of (ΔG°) provides insights into reaction feasibility.

Common Pitfalls and How to Avoid Them

- Ignoring units: Always convert moles to molarity when applying equilibrium expressions.
- Mishandling signs: Pay attention to the change in moles (x) and ensure correct algebraic signs.
- Calculation errors: Use calculator carefully, especially while computing logs and products.
- Misinterpretation of (ΔG°) : Remember that a negative (ΔG°) indicates spontaneity under standard conditions.

Question How do I solve a DU A Unit Chemistry question involving molarity? To solve a molarity question, first identify the moles of solute and the volume of solution in liters. Then, use the formula $M = \text{moles of solute} / \text{liters of solution}$ to find the molarity. Rearrange the formula as needed to solve for the unknown. What is the common method to balance chemical equations in DU A Unit Chemistry questions? The common method is to balance the atoms of each element on both sides of the equation by adjusting coefficients, ensuring the total atoms of each element are equal on both sides. Start with complex molecules and balance elements appearing in the fewest compounds first. How can I determine the empirical formula from a DU A chemistry problem? To determine the empirical formula, convert the percentage composition to grams, then calculate moles of each element. Divide all mole values by the smallest number of moles to get the simplest whole-number ratio, which is the empirical formula. What approach should I take to solve gas law problems in DU A chemistry questions? Identify the given quantities (pressure, volume, temperature, moles) and use the appropriate gas law equation ($PV=nRT$, Boyle's law, Charles's law, etc.). Rearrange to solve for the unknown variable, ensuring units are consistent. How do I calculate pH from a given concentration in DU A Unit Chemistry? Use the formula $\text{pH} = -\log[\text{H}^+]$, where $[\text{H}^+]$ is the concentration of hydrogen ions. If dealing with a strong acid, assume complete dissociation. For weak acids, use the acid dissociation constant (K_a) to find $[\text{H}^+]$. What steps are involved in solving titration problems in DU A chemistry questions? Identify the known volume and concentration of the titrant or analyte. Use the titration formula ($M_1V_1 = M_2V_2$) to find the unknown concentration or volume. Pay attention to units and equivalence points. How do I determine the limiting reagent in a DU A Chemistry question? Calculate the moles of each reactant from their given masses and molar ratios. The reactant with the fewer moles reacting completely is the limiting reagent, which limits the amount of product formed. What is the best way to approach solved examples of atomic structure in DU A Unit Chemistry? Understand the concepts behind atomic models, quantum numbers, and electron configurations. Study solved examples step-by-step to see how to determine electron arrangements, atomic number, and mass number, building foundational understanding.

Example: Solving a Stoichiometry Problem

Suppose a question asks: "Calculate the mass of water produced when 5 grams of hydrogen gas reacts with excess oxygen."

Answer Breakdown:

- Write the Balanced Equation:

- Calculate Moles of Hydrogen:

Molar mass of $H_2 = 2 \text{ g/mol}$

Moles of $H_2 = 5 \text{ g} / 2 \text{ g/mol} = 2.5 \text{ mol}$

- Determine Moles of Water Produced:

From the balanced equation, 2 mol H_2 produce 2 mol H_2O , so the molar ratio is 1:1.

Moles of $H_2O = 2.5 \text{ mol}$

- Calculate Mass of Water:

Molar mass of $H_2O = 18 \text{ g/mol}$

Mass of $H_2O = 2.5 \text{ mol} \times 18 \text{ g/mol} = 45 \text{ g}$

Final Answer: 45 grams of water are produced.

Example: Find the molecular formula of a compound with an empirical formula CH_2O and a molar mass of approximately 180 g/mol.

Solution:

- Empirical formula mass: $12.01 + 2(1.008) + 16.00 = 30.03 \text{ g/mol}$
- Molecular formula multiple: $180 / 30.03 = 6$
- Molecular formula: $(\text{CH}_2\text{O})_6$

C. Gas Laws and Ideal Gas Calculations

Example: Determine the pressure exerted by 2 liters of CO_2 gas at 25°C and 1 atm.

Solution:

- Use $PV = nRT$. Since volume, temperature, and pressure are given, find moles: $n = PV / RT$
- Convert temperature to Kelvin: $25^\circ\text{C} + 273.15 = 298.15 \text{ K}$
- $R = 0.0821 \text{ L}\cdot\text{atm}/(\text{mol}\cdot\text{K})$
- $n = (1 \text{ atm})(2 \text{ L}) / (0.0821 \times 298.15) = 0.082 \text{ mol}$
- Since pressure is given, the problem may involve calculating other variables based on this data.

Interpreting and Utilizing Practice Problems for Exam Success

Success in chemistry assessments hinges on more than just knowing formulas; it requires problem-solving fluency and conceptual clarity.

Key tips include:
