History of International Harvester and Its Hit and Miss Engines

Origins of International Harvester

Founded in 1902 through the merger of several agricultural equipment companies, International Harvester quickly established itself as a leading manufacturer of farm machinery, trucks, and engines. The company's mission was to provide efficient, reliable equipment that could meet the demands of farmers and industrial users.

The Development of Hit and Miss Engines

During the early 20th century, International Harvester diversified its product line to include stationary engines designed to power equipment such as threshers, pumps, and sawmills. Among these, the hit and miss engine became particularly popular due to its straightforward design and efficiency.

The "hit and miss" mechanism was an innovative solution to conserve fuel and reduce wear by automatically shutting down the engine when full power was unnecessary, then restarting it when needed. International Harvester's models epitomized this technology, combining durability and ease of operation.

Understanding the Mechanics of Hit and Miss Engines

What Is a Hit and Miss Engine?

A hit and miss engine is a type of stationary internal combustion engine that automatically controls its speed by "hitting" (firing) or "missing" (skipping a power stroke) based on mechanical governors. This mechanism ensures the engine maintains a relatively constant speed despite varying loads.

Key Components of International Harvester Hit and Miss Engines

- Flywheel: Stores rotational energy, maintaining smooth operation.
- Governor: Regulates engine speed by controlling the ignition timing.
- Ignition System: Usually using magneto ignition for spark generation.
- Valves and Valve Gear: Control intake and exhaust of air-fuel mixture.
- Cylinder and Piston: Core of the engine where combustion occurs.
- Throttle and Carburetor: Manage fuel and air mixture intake.

How the Hit and Miss Mechanism Works

- Engine Starts: The engine begins running, and the governor monitors its speed.
- Speed Regulation: When the engine exceeds a set speed, the governor triggers the mechanism to "miss" the firing stroke, effectively skipping ignition.
- Firing (Hit): When the engine slows below a threshold, the governor allows the engine to "hit," firing the next cycle.
- Automatic Control: This cycle repeats, maintaining a steady RPM suitable for the connected load.

This simple yet effective control method was a game-changer in early engine design, providing automatic regulation without complex electronics.

Known for innovation and quality, the company produced a range of engines used in various applications, from small portable units to large stationary power sources.

The Significance of Hit and Miss Engines

Hit and Miss engines are a class of internal combustion engines that gained popularity in the early 1900s, primarily for agricultural and industrial use. Their unique operation, where the engine "hits" (fires) only when necessary, makes them efficient and mechanically interesting. International Harvester was among the prominent manufacturers of these engines, producing models that are now highly sought after by collectors.

The Anatomy of an International Harvester Hit and Miss Engine

Understanding the core components of these engines is essential for appreciation, maintenance, and restoration.

Key Components

- Cylinder and Piston: The heart of the engine, where fuel combustion occurs.
- Flywheel: Maintains rotational inertia, ensuring smooth operation.
- Governor Mechanism: Controls engine speed by regulating fuel intake based on load.
- Ignition System: Usually a magneto system that produces sparks for combustion.
- Valves and Valve Gear: Open and close to allow fuel and exhaust gases in and out.
- Lubrication System: Ensures moving parts are properly lubricated to reduce wear.
- Fuel System: Includes a carburetor or fuel tank, depending on model.

How the Hit and Miss Operation Works

The unique feature of hit and miss engines is their governor-controlled valve system:

- When the engine is running below its desired speed, the governor opens the throttle, allowing more fuel-air mixture into the cylinder.
- As the engine speeds up, the governor responds by closing the throttle valve.
- When the engine reaches the set speed, the governor "misses" firing the cylinder on certain cycles, hence the name. This cycle continues, maintaining a relatively constant speed.
